

ABSTRACT

A box body having a grating has a plurality of side faces, at least an upper cover face and at least a lower cover face. The side faces, the upper cover face and the lower cover face form at least a receiving space. At least two side faces of the box body have the grating, which faces outside the box body. The side faces having the grating have an image layer through which movable images or three-dimensional images can be displayed. At least a side face of the box body has an anti-piracy region. A barcode image layer can also be added. The region opposite to the barcode image layer has no grating.
